Healthcare Operations Dashboard

Total Patients

50

Total Appointments

200

Total Doctors

10

Total Revenue

551.25K

Status

- ☐ Cancelled
- ☐ Completed
- ☐ No-show
- ☐ Scheduled

Appointments by Status

Executive Summary

Healthcare organizations generate large volumes of operational data, but data has little value unless it supports timely decision-making. This interactive Power BI dashboard transforms operational healthcare data into an executive reporting solution by consolidating patient activity, appointment performance, provider metrics, and revenue into a single view. The result is faster access to insights and improved support for data-driven operational decisions.

Business Problem

Healthcare administrators often rely on multiple reports to evaluate operational performance. This fragmented approach makes it difficult to identify trends quickly and respond to operational challenges. This dashboard centralizes key performance indicators into a single interactive reporting solution.

Project Objectives

- Develop a centralized healthcare operations dashboard.
- Present KPIs in an executive-friendly format.
- Enable interactive analysis through filtering.
- Improve visibility into patient, appointment, provider, and revenue performance.

Tools & Technologies

Power BI • Power Query • DAX • Microsoft Excel

Data Preparation

The dataset was reviewed, validated, and modeled before visualization. Calculated measures, KPI cards, and interactive slicers were created to deliver an intuitive reporting experience.

Dashboard Highlights

Executive KPI cards summarize operational performance, appointment status visualizations highlight scheduling activity, and interactive filtering enables users to explore healthcare metrics dynamically.

Key Insights

The dashboard provides immediate visibility into patient activity, provider capacity, appointment trends, and revenue performance. Bringing these metrics together in one report allows stakeholders to identify patterns faster and make informed operational decisions.

Business Recommendations

Monitor cancellation and no-show trends, evaluate provider utilization, review KPIs routinely, and incorporate dashboard reporting into regular operational reviews to support continuous improvement.

Skills Demonstrated

Dashboard Development • Executive Reporting • KPI Design • Data Visualization • Business Analysis • Healthcare Analytics • Power BI • Power Query • DAX

Reflection

This project strengthened my ability to transform healthcare operational data into meaningful business intelligence. The focus extended beyond building visuals to creating an executive dashboard that communicates actionable insights and supports data-driven decision-making.
